Fig. 1.

This radiograph reveals an osteolysis of the right pubic bone, the left obturator ring, the sacrum and the greater trochanter of the right femur (Fig. 1). The patient was a 46-years-old woman with a 14-years evolution of a lymphatic malformation: Gorham-Stout disease [1,2]. Thoraco-abdomino-pelvic imaging did not reveal further irregularities. Blood tests did not reveal any anomalies such as inflammation or a dysregulation of phosphocalcic homeostasis. The protein electrophoresis, renal function and thyroid hormone were normal and no tumor markers were detected.

### Disclosure of interest

The authors declare that they have no competing interest.
